

The Revolutionary Approach in Body Shaping for Muscle & Fat

Dr Aggie Zatonska discusses her results using EMSCULPT NEO

The new innovative EMSCULPT NEO goes beyond the imaginable, introducing new opportunities for clinics and patients. Using a unique combination of synchronised radiofrequency (RF) and HIFEM+ technologies in one treatment, it is now possible to treat both muscles and fat simultaneously in one session. As such, it is a faster and more profitable solution than combining multiple procedures. With more than 40 peer-reviewed publications, EMSCULPT NEO's proprietary HIFEM technology has also become the most intensively researched modality used in non-invasive body shaping. The device has been recognised by peers around the world as well as by various international awards, such as the Best Body Sculpting Treatment by Instyle or the newest recognition by Safety in Beauty, Diamond Awards, in the category 'The Body Hero of the Year'.

Practitioner experience

Dr Aggie Zatonska, the founder and the medical director of Atelier Clinic in Egham, Surrey, has 13 years of experience in the non-surgical aesthetic sector and specialises in delivering the most subtle, natural results. The clinic is not only offering exclusive facial treatments, but it has expanded and balanced their offer of services with EMSCULPT NEO, which helps them target more body related concerns. "This allows our patients to become more confident and stronger. My patients want to feel well, stay fit, look their best, in the most natural way," she explained.

"Devices are increasingly becoming an integral part of our daily practice. They complement injectable treatments and allow to take skin and body care to the next level," shared Dr Zatonska. "Patients' expectations have evolved and trends are towards more holistic treatments and results. EMSCULPT NEO blends together the benefits of modern technology perfectly; by combining RF and HIFEM in a single treatment it allows us to address multiple patient concerns during a single treatment session. It is a perfect fit for the modern world: better results in less time," she added.

"Lockdown has resulted in an inactive year, we had to pause the gym and become more static. Many of our patients report that EMSCULPT NEO helped them improve their workout routines. It provides patients with an opportunity to focus on their body and to

start the process of change they've been meaning to implement," Dr Zatonska commented, adding, "The patients enjoy how versatile EMSCULPT NEO is, it targets muscle and fat in one treatment that can be performed on nine areas of the body including abdomen, buttocks, arms, thighs, and even calves," Dr Zatonska shared. The course of the treatment typically consists of four 30-minute sessions, scheduled one week apart. "We perform on average between six and 10 treatments per week and we recommend the treatment to be complemented together with evidence-based dietary recommendations. My favourite thing about EMSCULPT NEO is that it delivers consistent, empowering results that benefit patients' health and wellbeing," Dr Zatonska added.
